Cloud access & ISP

Cloud access & ISP

A cloud strategy always starts with the issues of connectivity and access to the cloud service provider. Without reliable connectivity, obtaining integrated cloud services can prove critical. When developing your cloud strategy, we therefore examine in detail which services are highly critical, critical and non-critical. Based on this assessment, a distinction is made using the cloud strategy between the services that can be outsourced and those that cannot. We offer you an absolutely secure and direct connection to the DTS cloud. Not only are we well connected to the public clouds, i.e. AWS, Azure and GCP, but we also offer you the option of direct connection to the cloud.

Of course, the classic use of cloud services from the DTS cloud or from connected public cloud providers is possible via site-2-site VPN. However, we also place a great deal of emphasis on the security of the connection to the cloud and will be happy to advise you on the conceptual design of a completely secure connection option. In addition, data center operation for us means establishing a connection for the customer to the DTS service offered or generally between customer sites. We therefore offer a comprehensive range of services not only in the area of cloud access, but also in site networking and Internet Service Providers (ISP).

- Development of a customized strategy for cloud connectivity
- Needs-based analysis
- Optimization of data lines
- High-quality networking in line with requirements
- Reliable, direct, secure cloud connection
- Best data lines

At DTS, we only use existing fiber-optic cables to meet customer demand and connect our own data centers. Even in smaller towns and communities, the demand for fast, high-quality data lines is increasing. We offer scalable MPLS and Ethernet services. In order to provide the best possible connection, we work together with local telecommunications companies. In this way, we can cover your entire region. We guarantee data lines with bandwidths of 10, 100, 1,000 and 10,000 Mbit/s across the board on our own transmission network, naturally with microwave links.

Optimization of data lines is also an elementary part of our services. If it is only possible to increase bandwidths at extremely high cost, our WAN optimization is a good choice. Together with our solution partner and global market leader Riverbed, we can offer you the best and fastest solution in this area.
